

Amendments to the Claims:

This listing of the claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (currently amended): Device for producing concrete molded blocks, having a molding insert comprising one or more mold cavities and having a mold frame, in order to hold the molding insert in a molding machine, particularly during a vibration process, ~~wherein~~ comprising at least one accommodation for connecting a sensor with the molding insert, for local determination of a movement variable of the molding insert.

Claim 2 (previously presented): Device according to claim 1, wherein the accommodation includes a recess between two surfaces of molding insert and mold frame that face one another.

Claim 3 (previously presented): Device according to claim 2, wherein the recess is delimited on at least four sides by surfaces of the mold frame and the molding insert.

Claim 4 (previously presented): Device according to claim 2, wherein the recess has an expanse of at least 10 mm in all directions.

Claim 5 (previously presented): Device according to claim 2, wherein the recess is open towards the side and/or towards the bottom.

Claim 6 (previously presented): Device according to claim 1, wherein the accommodation is offset from an edge-position mold cavity of the molding insert towards its edge.

Claim 7 (previously presented): Device according to claim 1, wherein a recess is made in the outside wall of the molding insert for the accommodation.

Claim 8 (previously presented): Device according to claim 1, wherein the accommodation contains a projection that faces the mold frame, on an outside wall of the molding insert.

Claim 9 (previously presented): Device according to claim 8, wherein the projection is configured as a material-homogeneous continuation of the molding insert.

Claim 10 (previously presented): Device according to claim 8, wherein the continuation is set onto the molding insert, particularly welded on.

Claim 11 (previously presented): Device according to claim 8, wherein the projection projects into a depression of the mold frame.

Claim 12 (previously presented): Device according to claim 8, wherein the mold frame has a hole through a wall in the position of the projection.

Claim 13 (previously presented): Device according to claim 1, wherein the accommodation is removed by maximally 100 mm, particularly maximally 50 mm, from a corner of the molding insert, along an outside edge of the molding insert.

Claim 14 (previously presented): Device according to claim 1, wherein the accommodation is disposed at a distance from the edge of the molding insert, between two adjacent mold cavities.

Claim 15 (previously presented): Device according to claim 14, wherein a guide channel leads from the accommodation to a side surface of the molding insert.

Claim 16 (previously presented): Device according to claim 1, wherein the molding insert is structured in one piece.

Claim 17 (previously presented): Device according to claim 1, wherein the molding insert is structured with material homogeneity.

Claim 18 (previously presented): Device according to claim 1, wherein at least part of the walls of the molding insert are structured to be double-shelled.

Claim 19 (previously presented): Device according to claim 1, wherein a guide channel that leads to the accommodation is

configured in the mold frame.

Claim 20 (previously presented): Device according to claim 1, wherein the accommodation has a threaded bore.

Claim 21 (previously presented): Device according to claim 1, wherein the accommodation has a threaded pin.

Claim 22 (previously presented): Device according to claim 1, wherein damping means, particularly rubber-elastic material, is/are inserted between molding insert and mold frame.

Claim 23 (previously presented): Device according to claim 1, wherein four accommodations are provided along the circumference of the molding insert.

Claim 24 (previously presented): Device according to claim 1, wherein an accommodation is provided approximately in the center of the surface of the molding insert.

Claim 25 (previously presented): Arrangement having a

device according to claim 1, and a sensor connected with the molding insert by means of the accommodation.

Claim 26 (previously presented): Arrangement according to claim 25, wherein the sensor is releasably connected with the molding insert, in destruction-free manner, in the accommodation.

Claim 27 (previously presented): Arrangement according to claim 26, wherein the molding insert is held in the mold frame, movable to a slight extent relative to the latter, during the vibration process.

Claim 28 (previously presented): Arrangement according to claim 27, wherein at least one additional movement sensor is disposed on the mold frame, and that an evaluation unit determines at least one movement variable of the relative movement between mold frame and molding insert.

Claim 29 (canceled).
